

ABSTRACT

An extensible handle includes an elongated inner member and an elongated outer member. The outer member is hollow and telescopically receives the inner member. The inner member includes a section having an expanded width, and the
5 outer member includes a restriction so that when the section having expanded width contacts the restriction, the inner member is prevented from fully passing through the outer member. The extendability of the handle allows the handle to be used with vehicle part jacks and other applications where handles of varying lengths are desired.
